Comment on volumes: For inventory purposes the arisings are assumed to arise at a uniform rate over 6 years. Final Dismantling & Site Clearance is assumed to commence in 2085 with reactor dismantling commencing in 2089 and lasting for 6 years. The volumes and radioactivity have been calculated for 85 years after reactor shutdown, i.e. 2089

Uncertainty factors on volumes: Stock (upper): x Arisings (upper) x 1.2
 Stock (lower): x Arisings (lower) x 0.8

RADIOACTIVITY

WASTE STREAM**2C304****Graphite LLW**

Source:	Activation of the graphite and impurities.
Uncertainty:	The values quoted were derived by calculation from available material specification and are indicative of the activities that are expected. The major source of uncertainty is the impurity levels.
Definition of total alpha and total beta/gamma:	Total beta/gamma is defined as the sum of the listed activities of all nuclides other than alpha emitters. Activity estimates for individual alpha emitting nuclides have not been provided.
Measurement of radioactivities:	The specific activities have been estimated using a neutron activation calculation.
Other information:	There may be some contamination by Cs137. The activities quoted are those at 85 years after reactor shutdown, i.e. in 2089. Fission of trace uranium impurity in the graphite may result in some fission product and nuclide activity.
