Total waste volume:		457.6 m ³

Comment on volumes: Arisings are in line with current decommissioning programmes and strategy. Waste within this waste stream is generated from decommissioning projects which will commence at a future date. As a result of this, minimal characterisation of waste volumes and fingerprints has been carried out and hence there is a large uncertainty in the potential arisings. Preliminary assessments indicate that the volumes may vary from -50% to +300% for LLW.

Uncertainty factors on volumes:
 Stock (upper): x Arisings (upper) x 4.0
 Stock (lower): x Arisings (lower) x 0.5

RADIOACTIVITY

Source: The main sources of activity are uranium isotopes.

Uncertainty: Waste within this waste stream is generated from a number of decommissioning projects which will commence at a future date. The uncertainties quoted for each nuclide represent both the uncertainty in quantification without detailed sampling and the likely variation of nuclide in different building consigned wastes under this waste stream. It is exceptionally unlikely that all the waste included in this waste stream will have the same variation in nuclide fingerprint. Also activity levels will depend on degree of decontamination achieved.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: -

Other information: Other alpha not specified. Other beta/gamma includes Co58 1.22E-12 TBq/m³, Sr89 9.29E-14 TBq/m³, Zr95 1.55E-10 TBq/m³, Nb95 1.38E-10 TBq/m³ and Ru103 5.39E-11 TBq/m³. Nuclides making up remaining "other beta/gamma" not specified.
