TREATMENT, PACKAGING AND DISPOSAL

Planned on-site / off-site treatment(s):

Treatment	On-site / Off site	Stream volume %
Low force compaction Supercompaction (HFC)	On-site	75.9
Incineration Solidification Decontamination Metal treatment Size reduction Decay storage Recycling / reuse Other / various	Off-site	0.37
None		23.8

Comment on planned treatments:

All high force compaction takes place in WAMAC. Waste not requiring treatment is predominantly 'out of scope' metal.

RADIOACTIVITY

Source:

The activity arises from operations and maintenance activities within the Thorp chemical separation area and originates from irradiated AGR and PWR oxide fuel.

Uncertainty:

The uncertainty associated with the fingerprinting analysis is likely to be low, however the volumes and total activity information (and possibly some other assumptions) are likely to be more notional and thus more uncertain.

Definition of total alpha and total beta/gamma:

Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities:

Specific activity data is based on data in the corresponding WCH, which in turn maps an estimated total activity to an analytically derived radionuclide fingerprint.

Other information:

The radionuclides have been taken from DEC-0848A and are based on the current WCH (LLWR Ref: 1S-1S-0-WCH-0-4579).
