WASTE SOURCE Waste arises from the treatment of active effluent. Occasionally sludge cannot be transferred to purpose built storage vessels and is removed from process/treatment vessels into drums, IBCs or similar containers for storage prior to characterisation and disposal.

PHYSICAL CHARACTERISTICS

General description: Sludge recovered from active effluent treatment plant vessels.

Physical components (%wt): Sludge (100% vol), no other items have been identified.

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): ~1.6

Comment on density: Waste density is an estimate based on average of current arisings.

WASTE STREAM**3L18****Miscellaneous Sludges****RADIOACTIVITY**

Source:	Contaminated sludge. Contamination by activation products will be the main source of activity.
Uncertainty:	Characterisation not yet complete.
Definition of total alpha and total beta/gamma:	Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
Measurement of radioactivities:	Waste is Sludge removed from AETP process Tanks. Activity values taken from existing AETP sludge Tank (3L16). Nuclides likely to be present in significant quantities estimated from sludge waste stream 3L16.
