**TREATMENT, PACKAGING AND DISPOSAL**

Planned on-site / off-site treatment(s):

Treatment	On-site / Off site	Stream volume %
Low force compaction		
Supercompaction (HFC)	Off-site	~10.0
Incineration	Off-site	~70.0
Solidification	Off-site	<5.0
Decontamination		
Metal treatment	Off-site	~10.0
Size reduction		
Decay storage		
Recycling / reuse		
Other / various		
None		~5.0

Comment on planned treatments:

Material breakdown is not presently assessed but future arisings are expected to be similar to routine operational low level waste arisings. In line with the waste hierarchy, wastes will be treated preferentially by incineration, metal decontamination/melting, supercompaction, optimal packaging in HHISOs or immobilisation by encapsulation where necessary, prior to ultimate disposal at the LLW Repository. These treatments will be carried out off-site under contract with companies such as LLWR Ltd, EDF Cyclife, Tradebe and Inutec. The percentages are based on the history of consignments across the fleet of EDF Energy Nuclear Generation stations.

**RADIOACTIVITY**

Source:

Contamination by activation products from the reactor structure.

Uncertainty:

Only very approximate estimates have been made of the total specific activities.

Definition of total alpha  
and total beta/gamma:

Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of  
radioactivities:

Activity values based on current operational wastestreams suitably decay corrected.

Other information:

No nuclides other than those listed are expected to be significant.
