Other information:

The majority of waste consists of 200 litre drums that have already been compacted. No further compaction is possible. The remains of the waste are drums awaiting compaction which are in temporary storage. All drums, once compacted will go into HHISO containers, mixed with bulk LLW wastes, prior to encapsulation and final disposal.

RADIOACTIVITY

Source: A mixture of fission products, actinides and activation products.

Uncertainty: Activity is based on consignor's records.

Definition of total alpha and total beta/gamma: Total alpha and beta/gamma are derived from consignor's records for the waste stored in the containers.

Measurement of radioactivities: The specific activities have been measured or derived using consignment data. Consignment data was collated and summed together, then divided by the total volume of consignments. A decay was applied to the average consignment date of the consignments.

Other information: There are no unlisted radionuclides present at significant concentrations.
