## WASTE STREAM 9A51 FED Stainless Steel

| | |
|---|---|
| **SITE** | Berkeley |
| **SITE OWNER** | Nuclear Decommissioning Authority |
| **WASTE CUSTODIAN** | Magnox Limited |
| **WASTE TYPE** | ILW |

**WASTE VOLUMES**

| | | Reported |
|---|---|---|
| Stocks: | At 1.4.2019..... | 0.1 m³ |
| Total future arisings: | | 0 m³ |
| Total waste volume: | | 0.1 m³ |

Comment on volumes: Station operation ceased in March 1989. This waste stream was accumulated between May 1991 and December 1993. The stainless steel was used for flux flattening and was replaced by zirconium on later elements as fuel irradiation had increased and flux flattening by the stainless steel was not required. The volume quoted is the estimated bulk volume of the waste if separated from other wastes with which it is mixed.

Uncertainty factors on volumes:

| | | | |
|---|---|---|---|
| Stock (upper): | x 1.1 | Arisings (upper) | x |
| Stock (lower): | x 0.9 | Arisings (lower) | x |

**WASTE SOURCE** The source of the waste is the removal of graphite struts and associated zirconium and stainless steel bridge pieces from fuel elements prior to dispatch of the elements to Sellafield.

### PHYSICAL CHARACTERISTICS

General description: The waste comprises predominantly stainless steel bridge pieces. The bridge pieces may still be connected to the graphite struts (see waste stream 9A35). Approximately 38% of fuel elements used stainless steel top support bridges, (with the rest being zirconium). There will also be a small quantity of nimonic springs, which may be attached to thermocouple wires. A stainless steel top support bridge is 127mm in length and weighs aproximately 26g and a Nimonic spring weighs approximately 5g. The thermocouple wires are approximately 380mm in length. It is unlikely that there will be any large items which will require special handling. The waste is loose in the vaults.

Physical components (%wt): Stainless steel bridge pieces (>98.5% wt), Nimonic springs (~0.75% wt) and thermocouples wires (0.75% wt).

Sealed sources: -

Bulk density (t/m³): 2.6

Comment on density: The average bulk density of 2.6 t/m³ assumes a packing factor to give an overall volume of about three times the displacement volume of the waste.

### CHEMICAL COMPOSITION

General description and components (%wt): Stainless steel will account for more than 98.5% of the waste, with 0.75% Nimonic and 0.25%, alumina, magnesia and other minor constituents. The stainless steel may be contaminated with fission product, actinides and graphite.

Chemical state: Neutral

Chemical form of radionuclides:
H-3: Tritium will probably be present as surface contamination, possibly as water or perhaps as other inorganic or organic compounds.
C-14: Carbon 14 may be present as carbon incorporated in the stainless steel and is likely to be in the form of graphite contamination.
Cl-36: Chlorine 36 will probably be present in surface contamination.
Se-79: The selenium content is insignificant.
Tc-99: The technetium content is insignificant.
Ra: Radium isotope content is insignificant.
Th: The thorium isotope content is insignificant.
U: Chemical form of uranium isotopes has not been determined but may be uranium oxides.
Np: The neptunium content is insignificant.
Pu: Chemical form of plutonium isotopes has not been determined but may be plutonium oxides.

Metals and alloys (%wt): The items will typically be 127 mm x 25 mm x 17 mm.

### RADIOACTIVITY

Source: Activation when the associated fuel elements were irradiated, of nuclides incorporated into the stainless steel. Contamination by fission products and actinides when the fuel elements were in the fuel pond.

Uncertainty: The values quoted are indicative of the activities that might be expected.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Specific activity is a function of Station operating history. Values were derived from calculations of induced activity and estimates of likely contamination.

Other information: -
