WASTE SOURCE Redundant HP instrumentation/BCD/gamma alarm sources.

PHYSICAL CHARACTERISTICS

General description: Various redundant sealed sources.

Physical components (%wt): Plastic (60%), Paper (30%), Metal (10%)

Sealed sources: -

Bulk density (t/m³): ~1

Comment on density: Density refers to sources on bases only, when they have been stripped of all extraneous materials, which are disposed of as non-active material. Redundant sources will then be encapsulated for disposal as LLW.

Other information:

Only one paint-tin type container is allowed per disposal container for sealed sources. It is expected that this stream will be disposed with other LLW streams. Waste will not be drummed and supercompacted but encapsulated into 100ml grout.

Waste Planned for Disposal at the LLW Repository:

Container voidage: -

Waste Characterisation Form (WCH):

The waste meets the LLWR's Waste Acceptance Criteria (WAC).
The waste does not have a current WCH.

Waste consigned for disposal to LLWR in year of generation:

No. Disposal may be phased since only one container of sources may be included in each Half-height ISO.

Potential for the waste to contain discrete items:

-

Non-Containerised Waste for In-Vault Grouting: (Not applicable to this waste stream)

Stream volume (%): -

Waste stream variation: -

Bounding cuboidal volume:

Inaccessible voidage: -

RADIOACTIVITY

Source: Sources, mostly used for calibration of instrumentation and in smoke alarms.

Uncertainty: Stock activities have been taken from site source register and decayed to reference date of 01/04/2019. Future arising source activities have been taken from site source register and decayed to reference date of 01/04/2023.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: -
