Total waste volume:	3633.2 m ³

Comment on volumes: For inventory purposes the arisings are assumed to arise at a uniform rate over four years. Final Dismantling & Site Clearance is assumed to commence in 2104, with reactor dismantling commencing in 2107, and lasting for ten years. Volumes and radioactivity have been calculated for 100 years after reactor shutdown, i.e. 2103, but the volume in this stream would not change for decommissioning in 2107.

Uncertainty factors on volumes: Stock (upper): x Arisings (upper) x 1.2
Stock (lower): x Arisings (lower) x 0.8

WASTE SOURCE Moderator graphite from reactor dismantling.

PHYSICAL CHARACTERISTICS

General description: Graphite blocks and other graphite components.

Physical components (%vol): Graphite (100%).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): 1.25

Comment on density: Density estimate based upon the assumed packing efficiency of the waste. The density is the effective density for packaging assuming 90% of the graphite is in blocks and 10% is rubble.

CHEMICAL COMPOSITION

General description and components (%wt): Graphite and possibly traces of ferrous metals.

Chemical state: Neutral

Chemical form of radionuclides: H-3: Tritium may be chemically bound with the graphite.
C-14: The carbon 14 will be present as graphite.

Cl-36: The chlorine content is insignificant.

Se-79: The selenium content is insignificant.

Tc-99: The technetium content is insignificant.

I-129: The iodine content is insignificant.

Ra: The radium content is insignificant.

Th: The thorium content is insignificant.

U: There may be traces of uranium as metal or oxide.

Np: The neptunium content is insignificant.

Pu: There may be traces of plutonium as metal or oxide.

Metals and alloys (%wt): There are no metallic items present.

RADIOACTIVITY

Source:	Activation of the graphite and impurities.
Uncertainty:	The values quoted were derived by calculation from available material specification and are indicative of the activities that are expected. The major source of uncertainty is the impurity levels.
Definition of total alpha and total beta/gamma:	Total beta/gamma is defined as the sum of the listed activities of all nuclides other than alpha emitters. Activity estimates for individual alpha emitting nuclides have not been provided but an estimate of total alpha activity is given.
Measurement of radioactivities:	The specific activities have been estimated using a neutron activation calculation.
Other information:	Other beta/gamma represents Sm146 activity. There may also be some contamination by Cs137. The activities quoted are those at 100 years after reactor shutdown, i.e. in 2103. Fission of trace uranium impurity in the graphite may result in some fission product and actinide activity.
