Total future arisings:		654.0 m ³
Total waste volume:		654.0 m ³
Comment on volumes:	For inventory purposes the arisings are assumed to arise at a uniform rate over four years. Final Dismantling & Site Clearance is assumed to commence in 2104, with reactor dismantling commencing in 2107, and lasting for ten years. Volumes and radioactivity have been calculated for 100 years after reactor shutdown, i.e. 2103, but the volume in this stream would not change for decommissioning in 2107.	
Uncertainty factors on volumes:	Stock (upper): <input checked="" type="checkbox"/>	Arisings (upper) x 2.0

WASTE SOURCE	Mild steel items from the reactor structure.	
PHYSICAL CHARACTERISTICS		
General description:	A variety of mild steel items.	
Physical components (%vol):	Mild steel items (100%).	
Sealed sources:	The waste does not contain sealed sources.	
Bulk density (t/m ³):	1.4	
Comment on density:	The density is of the waste as cut for packaging.	
CHEMICAL COMPOSITION		
General description and components (%wt):	Mild steel (includes small amounts of cast iron) (100%).	
Chemical state:	Neutral	
Chemical form of radionuclides:	H-3: The tritium is incorporated in the steel. C-14: The carbon 14 is incorporated in the steel. There also may be some contamination as graphite. Cl-36: The chlorine is incorporated in the steel Se-79: The selenium content is insignificant. Tc-99: The chemical form of technetium has not been determined. I-129: The iodine content is insignificant. Ra: The radium content is insignificant. Th: The thorium content is insignificant. U: The uranium content is insignificant. Np: The neptunium content is insignificant. Pu: The plutonium content is insignificant.	
Metals and alloys (%wt):	All of the waste will be bulk metal items which will be cut for packaging. Metal thicknesses will probably range from a few mm to about 100 mm.

RADIOACTIVITY

Source:	Activation of the mild steel and its impurities.
Uncertainty:	The values quoted were derived by calculation from available material specifications and are indicative of the activities that are to be expected. The major source of uncertainty is the impurity levels.
Definition of total alpha and total beta/gamma:	Total beta/gamma is defined as the sum of the listed activities of all nuclides other than alpha emitters. All alpha emitter activities are insignificant and the total is therefore given as <1E-9 TBq/m ³ .
Measurement of radioactivities:	The specific activities have been estimated using a neutron activation calculation.
Other information:	The activities quoted are those at 100 years after reactor shutdown, i.e. in 2103. There may be some contamination by Cs137.
