Total waste volume:		80.0 m ³

Comment on volumes: For inventory purposes the arisings are assumed to arise at a uniform rate over four years. Final Dismantling & Site Clearance is assumed to commence in 2104, with reactor dismantling commencing in 2107, and lasting for ten years. Volumes and radioactivity have been calculated for 100 years after reactor shutdown, i.e. 2103, but the volume in this stream would not change for decommissioning in 2107.

Uncertainty factors on volumes: Stock (upper): x Arisings (upper) x 2.0
 Stock (lower): x Arisings (lower) x 0.5

WASTE SOURCE Stainless steel items from reactor dismantling.

PHYSICAL CHARACTERISTICS

General description: A variety of stainless steel items.

Physical components (%vol): Stainless steel items (100%).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): 1.4

Comment on density: The density is of the waste as cut for packaging.

CHEMICAL COMPOSITION

General description and components (%wt): Stainless steel items (100%).

Chemical state: Neutral

Chemical form of radionuclides: H-3: The tritium content is insignificant.
 C-14: The carbon 14 is incorporated in the steel. There may also be some contamination as graphite.
 Cl-36: The chlorine is incorporated in the steel
 Se-79: The selenium content is insignificant.
 Tc-99: The chemical form of technetium has not been determined.
 I-129: The iodine content is insignificant
 Ra: The radium content is insignificant.
 Th: The thorium content is insignificant.
 U: The uranium content is insignificant.
 Np: The neptunium content is insignificant.
 Pu: The plutonium content is insignificant.

Metals and alloys (%wt): Items have been cut for packaging. Thicknesses are likely to vary from a few mm to about 25 mm.

RADIOACTIVITY

Source:	Activation of the stainless steel and impurities.
Uncertainty:	The values quoted were derived by calculation from available material specification and are indicative of the activities that are expected. The major source of uncertainty is the impurity levels.
Definition of total alpha and total beta/gamma:	Total beta/gamma is defined as the sum of the listed activities of all nuclides other than alpha emitters. All alpha emitter activities are insignificant and the total is therefore given as $<1\text{E-}9$ TBq/m ³ .
Measurement of radioactivities:	Specific activities have been estimated using a neutron activation calculation.
Other information:	The activities quoted are those at 100 years after reactor shutdown, i.e. in 2103. There may be some contamination by Cs137.
