WASTE SOURCE

Irradiated ceramic pellet waste from post reactor operations.

PHYSICAL CHARACTERISTICS

General description:	The waste consists of irradiated ceramic pellet waste. The pellets are whole or fragmented. They are stored in '304 type' stainless steel cans, which forms part of the waste stream.
Physical components (%wt):	Ceramic pellets (69%) SS Can (31%).
Sealed sources:	The waste does not contain sealed sources.
Bulk density (t/m ³):	1.3
Comment on density:	The mean density of 1.3t/m ³ refers to the mass of the components divided by the volume as stored.

RADIOACTIVITY

Source: The material is contaminated, mainly with tritium.

Uncertainty: The activity values are based on sampling, and the accuracy is about 50%.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: The activity values are based on sampling. Copied from 2C06
