WASTE CUSTODIAN Sellafield Limited

WASTE TYPE ILW

Is the waste subject to Scottish Policy: No

WASTE VOLUMES

| | | |
|------------------------|------------------|----------------------|
| | | Reported |
| Stocks: | At 1.4.2022..... | 440.0m ³ |
| Total future arisings: | | 0 m ³ |
| Total waste volume: | | 440.0 m ³ |

Comment on volumes: There will be no future arisings to this stream. It is believed that a more or less complete inventory is available for Cell 8 from tipping records; this gives a total volume of 55m³. This has been assumed to be the volume of waste in every cell, hence total waste = 8 x 55 = 440m³. All of this volume is conservatively assumed to be ILW.

Uncertainty factors on volumes: Stock (upper): x 1.25 Arisings (upper) x
 Stock (lower): x 0.5 Arisings (lower) x

WASTE SOURCE In cell stored waste was general operational waste associated with disposal of contaminated plant items and secondary wastes. Also, HEPA filters from ventilation systems, stored in mild steel boxes.

PHYSICAL CHARACTERISTICS

General description: Miscellaneous (beta/gamma active) solid waste (redundant pipework, plant equipment, HEPA filters, etc). The waste includes a mast 28 ft long, a cast iron flask (approx 42 t) and two concrete blocks (6 t each). Free liquor has been identified in one of the cells however this is due to be removed prior to waste export. Cells were originally open to the weather and so the cell wastes have deteriorated due to the damp conditions that occurred.

Physical components (%vol): Redundant pipework, plant equipment, HEPA filters in mild steel boxes, concrete/rubble. Metals (iron, steel, lead) 75%, organics (paper, wood, PVC, soil) 10%, concrete 10%, glass fibre <5%.

Sealed sources: -

Bulk density (t/m³): *2.5

Comment on density: * The density has been estimated from typical values for broken ferrous scrap. The average density of HEPA filters is 0.2 t/m³ as stored.

CHEMICAL COMPOSITION

General description and components (%wt): Metals (iron, steel, lead) >75%, organics (paper, wood, PVC, soil) <10%, concrete <10%, glass fibre <5%.

Chemical state: Neutral

Chemical form of radionuclides: H-3: NE
 C-14: NE
 Cl-36: NE
 Se-79: NE
 Tc-99: NE
 I-129: NE
 Ra: NE
 Th: NE
 U: NE
 Np: NE
 Pu: NE

Metals and alloys (%wt): Both sheet and bulk metal likely to be present, proportions not estimated.

WASTE STREAM

Organics (%wt):

The average organic content of stocks and arisings is 4.5 wt%. Cellulosics, halogenated and non-halogenated plastics are present. Additionally soil and bird carcasses may be present. Halogenated plastic and rubber may be present, materials not specified due to the uncertainty of the waste in the concrete cells. PVC is known to be present.

Other organic complexants.....
Total complexing agents..... 0

Potential for the waste to contain discrete items: Yes. Steel fabrications, a redundant flask and retrieval tools are likely to be included in this waste stream.

PACKAGING AND CONDITIONING

Conditioning method: It is proposed to retrieve the waste and place it into liners which will be placed into a DCC when DEP is available to take the waste. The Waste may be size-reduced or low-force compacted to improve the packing efficiency. At DEP, the DCC will be flood grouted and the grouted boxes will be placed into the Lightly Shielded Stores. Some boxes may contain waste not suitable for direct encapsulation or storage in a geological repository; the processing route for these is not yet defined.

Plant Name: DEP
Location: Sellafield.
Plant startup date: DEP 2027
Total capacity (m³/y incoming waste): -
Target start date for packaging this stream: -
Throughput for this stream (m³/y incoming waste): -

Other information: Packaging capacity requirements depend upon the final amount of cell waste which is ILW. It is assumed that 75% of the cell waste is ILW but this figure could be as low as 25%.

| Likely container type: | Container | Waste packaged (%vol) | Waste loading (m ³) | Payload (m ³) | Number of packages |
|------------------------|-----------|-----------------------|---------------------------------|---------------------------|--------------------|
| | Other | ~100.0 | ~2.1 | ~2.1 | 210 |

Likely container type comment: -

Range in container waste volume: There is likely to be a range of unconditioned waste per container due to the diverse nature of the cell inventory.

Other information on containers: Steel 3m³ box - specification is still being quantified (may be DCC)

Likely conditioning matrix: Other information: Cementitious grout, matrix not yet defined.

Conditioned density (t/m³): ~1.3

Conditioned density comment: This conditioned waste density is calculated from the conditioned waste volume and mass of the waste.

Other information on conditioning: -

Opportunities for alternative disposal routing: Yes

WASTE STREAM**2D21****Solid Waste Storage Cells**

| Baseline Management Route | Opportunity Management Route | Stream volume (%) | Estimated Date that Opportunity will be realised | Opportunity Confidence | Comment |
|--|------------------------------|-------------------|--|------------------------|---|
| Disposal at a Geological Disposal Facility | Disposal at LLWR | NE | - | Medium | Some of this waste may be suitable for LLWR but quantities cannot yet be specified. |

RADIOACTIVITY

| | |
|---|--|
| Source: | The activity arises from activated steel or from fixed beta/gamma or alpha emitting contaminants (miscellaneous). |
| Uncertainty: | The specific activities have been derived by calculation. A number of assumptions have been made in the calculation and additional uncertainties introduced due to the following: The four main plants have between them consigned approximately 84% of the recorded inventory. The highest recorded dose rates are up to 1 order of magnitude greater than the average dose rate and upto 2 orders of magnitude greater than the lowest dose rates. Waste consignments started in the early 1970s and hence some waste will have had over 40 years decay. The known inventory records cover approximately 60% of the total assumed inventory. |
| Definition of total alpha and total beta/gamma: | No allowance has been included in the total alpha and total beta/gamma activities for nuclides other than those listed. No data is available to allow 'other' nuclides to be estimated. |
| Measurement of radioactivities: | Fingerprints for wastes from the four main consignors have been determined. These have been used in conjunction with dose rates at time of tipping, assumed to be 1986, and decayed to 2019, to calculate the specific activities in average case packages for each main consignor, then averaging these in line with the volume percent of waste consigned from each plant. |
| Other information: | - |
