ILW WASTE TYPE

Is the waste subject to Scottish Policy:

No

WASTE VOLUMES

Reported Stocks: At 1.4.2022..... $0.8 \, \text{m}^3$ 1.4.2022 - 31.3.2025....... $0.1 \, \text{m}^{3}$ Future arisings -Total future arisings: $0.1 \, \text{m}^3$ Total waste volume: $0.9 \, \text{m}^3$

Comment on volumes:

The rate of waste arising from current analyses will reduce as operational plants come to the end of their life. However, there is likely to be an increase in analyses from new routes associated with wastes from legacy plant. Additionally, methods to dispose of the waste are being brought on line so an accelerated decrease in stocks held is expected in the next 2-5 years. The rate of disposals cannot be predicted at this time. Arisings are given at the current rate for the life time of the current plant (Analytical Services Facility). No arisings are attributed to future (Analytical Services Facility) replacement plants. This is due to uncertainty surrounding the nature of analytical methods to be used in the future, as it is hoped to introduce methods that reduce waste arisings, with the aim of having no liquid waste arisings. Despite continued arisings, disposals/processing of waste will outstrip arisings in the next few years. At the current time the uncertainties are highly unpredictable to the point of providing little benefit. The long term aim is for processing of legacy waste to be complete and for ongoing processing to be at the arising rate, i.e.the aim is to have no stocks held for which there is low uncertainty.

WASTE SOURCE Analytical chemistry of site process samples.

PHYSICAL CHARACTERISTICS

General description: Physical components (%vol): Sealed sources: Bulk density (t/m3): 1.1

Comment on density: Density is variable depending on solute type and concentration.

CHEMICAL COMPOSITION

General description and components (%wt):

Most of the samples comprise plutonium dissolved in nitric acid. A wide range of other chemical species are present depending on reagents used for specific tests. In some instances there is a clear understanding of bottle contents due to accurate knowledge of analyses undertaken; in other instances this information is not available and the history of the bottle contents is highly uncertain. It is expected that a general GCMS analysis will be used to reduce the uncertainly for such bottles to ensure appropriate disposal.
