

WASTE STREAM	2F35	Tn 17 and NTL 11 Flasks
---------------------	-------------	--------------------------------

SITE Sellafield
SITE OWNER Nuclear Decommissioning Authority

WASTE CUSTODIAN Sellafield Limited

WASTE TYPE LLW; SPD1

Is the waste subject to Scottish Policy: No

WASTE VOLUMES

	Reported
Stocks: At 1.4.2022.....	128.2 m ³
Total future arisings:	0 m ³
Total waste volume:	128.2 m ³

Comment on volumes: Assumes a medium term strategy for decommissioning the NTL flasks. The total number of flasks identified is 10. The flasks are presently stored both dry inside buildings and outdoors with covers on at Sellafield. They are currently considered to be redundant and unlicensable. The volume declared is the volume of the flasks, however, it is planned to decontaminate and recycle the metal. If this is successful only small amounts of residues will arise for disposal. A study is currently being carried out to consider options for decommissioning the Japanese owned flasks on the Sellafield site, which may influence the overall decommissioning strategy for the other flasks.

Uncertainty factors on volumes: Stock (upper): x 1.5 Arisings (upper) x
Stock (lower): x 0.5 Arisings (lower) x

WASTE SOURCE Flasks become contaminated when used for the transport of irradiated fuel from European reactors.

PHYSICAL CHARACTERISTICS

General description: Steel and lead containers internally contaminated with fission and activation products and with some actinides possibly present. Flasks weigh between 23.6 and 62.9 tonnes. The waste has not undergone any changes since it was generated and is stored dry and inside a building. Flasks sometimes undergo chemical decontamination as part of routine maintenance.

Physical components (%vol): Irradiated fuel transport flasks (100%). Flask surfaces are painted with CEGB System 6 epoxy paint (~0.1% wt) and there is a rubber viton seal (<0.01% wt).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): 2.92

Comment on density: Density ranges from 2.65 to 3.2 te/m³. The weighted average density is 2.92 te/m³.

CHEMICAL COMPOSITION

General description and components (%wt): Stainless steel (2.85%), other ferrous metals (38.9%), lead (53.63%), resin (2.85%), cement (0.32%) and copper (1.45%).

Chemical state: Neutral

Chemical form of radionuclides: H-3: Trace quantities likely to be present in some part of the waste, but chemical composition unknown.
C-14: Trace quantities likely to be present in some part of the waste, but chemical composition unknown.
Se-79: Unknown if present.
Tc-99: Trace quantities likely to be present in some part of the waste, but chemical composition unknown.
Ra: Not anticipated to be present.
Th: Unknown if present.
U: Not anticipated to be present.
Np: Unknown if present.
Pu: Trace quantities likely to be present in some part of the waste, but chemical composition unknown.

Metals and alloys (%wt): Excellox flasks - 100% bulk metal. French flasks - 96% bulk metal. Ferritic metal typically 305 & 100 mm thick. Stainless steel is 5 & 27 mm thick. Lead in rings are 152 mm thick. This waste stream comprises various flasks with different specifications. Some flask specifications are as follows: Lid and base forging spec. BS 1503-224-28A-4T-50. Plate

WASTE STREAM	2F35	Tn 17 and NTL 11 Flasks
---------------------	-------------	--------------------------------

spec. BS 1501-224. Lead BS 3909/2 - 4% antimony content lead alloy. Lead liner spec. BS 1449-321-512. TN type flasks are ASTM A350 forgings. Other material 304L stainless steel sheet.

TREATMENT, PACKAGING AND DISPOSAL

Planned on-site / off-site treatment(s):

Treatment	On-site / Off site	Stream volume %
Low force compaction Supercompaction (HFC) Incineration Solidification Decontamination Metal treatment Size reduction Decay storage Recycling / reuse Other / various None		100.0

Comment on planned treatments:

Treatment will be via size reduction and decontamination, with an anticipated maximum of 5% of the flask assumed to then be disposed of to the LLWR as LLW. The remainder is anticipated to be free release scrap.

Disposal Routes:

Disposal Route	Stream volume %	Disposal density t/m3
Expected to be consigned to the LLW Repository	5.0	2.9
Expected to be consigned to a Landfill Facility		
Expected to be consigned to an On-Site Disposal Facility		
Expected to be consigned to an Incineration Facility	95.0	2.9
Expected to be consigned to a Metal Treatment Facility		
Expected to be consigned as Out of Scope		
Expected to be recycled / reused		
Disposal route not known		

Classification codes for waste expected to be consigned to a landfill facility: -

Upcoming (2022/23-2024/25) Waste Routing (if expected to change from above):

Disposal Route	Stream volume %

Other information: -

Waste Planned for Disposal at the LLW Repository:

Container voidage: -

Waste Characterisation Form (WCH): It is not yet determined if the waste meets LLWR's Waste Acceptance Criteria (WAC).
The waste does not have a current WCH.

No WCH currently in place for this waste. It will be developed at the time for disposal of the flasks.

Waste consigned for disposal to LLWR in year of generation: No. The waste from the remaining flasks will arise when the flasks are prepared for disposal. This is dependent upon work load and NDA strategy.

Non-Containerised Waste for In-Vault Grouting: (Not applicable to this waste stream)

Stream volume (%): -

Waste stream variation: -

Bounding cuboidal volume:

Inaccessible voidage: -

Other information: -

RADIOACTIVITY

Source: Fission and activation product contamination with some actinides possibly present arising from contact with spent fuel or cross contamination from items that have been in contact with spent fuel.

Uncertainty: -

Definition of total alpha and total beta/gamma: Total activity has not been estimated.

Measurement of radioactivities: -

Other information: -
