**TREATMENT, PACKAGING AND DISPOSAL**

Planned on-site / off-site treatment(s):

Treatment	On-site / Off site	Stream volume %
Low force compaction	On-site	72.4
Supercompaction (HFC)		
Incineration	Off-site	17.4
Solidification		
Decontamination		
Metal treatment

Other / various		
None		10.2

Comment on planned treatments:

All high force compaction takes place in WAMAC. For Inventory purposes, it is assumed that supercompaction will continue after the closure of WAMAC in 2028

**Waste Planned for Disposal at the LLW Repository:**

Container voidage: -

Waste Characterisation Form (WCH): The waste meets the LLWR's Waste Acceptance Criteria (WAC). The waste has a current WCH. Differences exist between Inventory information and current WCH. Materials and radioactivity data has been taken from the current WCH, but data on waste volumes and waste routes is based on the Waste Forecasting database as this information is more recent.

Waste consigned for disposal to LLWR in year of generation: Yes.

Bounding cuboidal volume:

Inaccessible voidage: -

**RADIOACTIVITY**

Source: The activity will have arisen due to historical operations in the laboratories.

Uncertainty: The uncertainty associated with the fingerprinting analysis is likely to be low, however the volumes and total activity information (and possibly some other assumptions) are likely to be more notional and thus more uncertain.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Specific activity data is based on data in the corresponding WCH, which in turn maps an estimated total activity to an analytically derived radionuclide fingerprint.

Other information: The radionuclides have been taken from REM\_TP\_0116A and are based on the current WCH (1S-1S-WCH-0-4602).
