Other information: -

**Waste Planned for Disposal at the LLW Repository:**

Container voidage: -

Waste Characterisation Form (WCH): The waste meets the LLWR's Waste Acceptance Criteria (WAC). The waste has a current WCH. Differences exist between Inventory information and current WCH. Materials and radioactivity data have been taken from the current WCH, but data on waste volumes and waste routes are based on the Waste Forecasting database as this information is more recent.

Waste consigned for disposal to LLWR in year of generation: Yes.

**Non-Containerised Waste for In-Vault Grouting:** (Not applicable to this waste stream)

Stream volume (%): -

Waste stream variation: -

Bounding cuboidal volume:

Inaccessible voidage: -

**RADIOACTIVITY**

Source: The activity is likely to have risen from the use of the cell for irradiated fuel examination work where a variety of fuels were handled.

Uncertainty: The uncertainty associated with the derived fingerprint is likely to be relatively low, however the volumes and total activity information (and possibly some other assumptions) are likely to be more notional and thus more uncertain.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Specific activity data is based on data in the corresponding WCH, which in turn maps an estimated total activity to an analytically derived radionuclide fingerprint.

Other information: The radionuclides have been taken from REM\_TP\_0116A and are based on the current WCH (Ref: 1S-1S-0-WCH-0-4569 Version 5).
