PACKAGING AND CONDITIONING

Conditioning method: The waste will be conditioned to satisfy the disposal requirements which are effective at the time of retrieval/conditioning. It is currently assumed that the waste

WASTE STREAM**3N41****Miscellaneous Activated Components - Debris Vault 4**

will be placed in "baskets" in the waste packages and will be encapsulated.

Plant Name: -
 Location: Hinkley point B Power Station
 Plant startup date: ~2107
 Total capacity (m³/y incoming waste): -
 Target start date for packaging this stream: -
 Throughput for this stream (m³/y incoming waste): -

Other information: All of the waste is expected to be retrieved and conditioned when a conditioning campaign is undertaken. The total plant process rate is not estimated.

Likely container type:	Container	Waste packaged (%vol)	Waste loading (m ³)	Payload (m ³)	Number of packages
	4m box (100mm concrete shielding)	100.0	~12.2	~14.3	< 1

Likely container type comment: -
 Range in container waste volume: -
 Other information on containers: Stainless steel.
 Likely conditioning matrix: BFS/OPC
 Other information: -
 Conditioned density (t/m³): ~3.0
 Conditioned density comment: The density of the encapsulated waste is expected to be approximately 3 t/m³.
 Other information on conditioning: Waste will be retained on site pending Final Site Clearance, to let nuclides such as Co-60 undergo considerable radioactive decay. Baskets of different Final Site Clearance ILW wastes may be in the same waste package.
 Opportunities for alternative disposal routing: No

RADIOACTIVITY

Source: Source of activity is activation with possible contamination by fission products and actinides.
 Uncertainty: Needs further assessment.
 Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
 Measurement of radioactivities: Theoretical estimates.
