### PACKAGING AND CONDITIONING

Conditioning method: The waste will be packaged into 160 l crates inside Z6033 200 litre drums. The drums will be packaged into 500 litre drums in the future.

Plant Name: RHILW Repackaging Facility

Location: Dounreay

Plant startup date: 2028

Total capacity (m<sup>3</sup>/y incoming waste): -

Target start date for packaging this stream: 2028

Throughput for this stream (m<sup>3</sup>/y incoming waste): -

Other information: RHILW Repackaging Plant is currently in the design phase.

Likely container type:	Container	Waste packaged (%vol)	Waste loading (m <sup>3</sup> )	Payload (m <sup>3</sup> )	Number of packages
	500 l drum	100.0	~0.27	0.5	66

Likely container type comment: -

Range in container waste volume: Waste loading will be variable and dependant on nuclear material content of the wastes. Assume 3:2 Z6033 to 500L drum ratio. Assume Z6033 loading @ 0.2m<sup>3</sup> = 0.6m<sup>3</sup> in 2 500L drums (1m<sup>3</sup>) = 0.3m<sup>3</sup> per 500L drum.

Other information on containers: -

Likely conditioning matrix: Cement

Other information: -

Conditioned density (t/m<sup>3</sup>): ~2.5

Conditioned density comment: Density is if waste is grouted directly into 500 litre drums. Assume density similar to CHILW repack.

Other information on conditioning: -

Opportunities for alternative disposal routing: No

### RADIOACTIVITY

Source: The main source of activity is the activated cladding and minor contamination from irradiated breeder fuel debris.

Uncertainty: Specific activities are best estimates on computer modelling. Both stocks and arisings data taken from LoC. Specific activities calculated using separate stocks and arisings volumes.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
