**WASTE VOLUMES**

## Reported

Stocks:	At 1.4.2022.....	0.1 m <sup>3</sup>
Future arisings -	1.4.2022 - 31.3.2023.....	<< 0.1 m <sup>3</sup>
	1.4.2023 - 31.3.2024.....	<< 0.1 m <sup>3</sup>
	1.4.2024 - 31.3.2025.....	<< 0.1 m <sup>3</sup>
	1.4.2025 - 31.3.2037.....	0.1 m <sup>3</sup>
Total future arisings:		0.2 m <sup>3</sup>
Total waste volume:		0.3 m <sup>3</sup>

Comment on volumes: Dates given to 2037 which is the planned date for shutdown of ISIS. From 2022 new TS1 targets used. The future rate of failure of the new TS1 target is conservatively estimated to be one (0.01m<sup>3</sup> unprocessed) every 2 years and one ISIS target station 2 target (0.01m<sup>3</sup> unprocessed volume) every 2 years. The useable lifetime of the targets and instrument use is a source of uncertainty. Additionally, the assumed volume of the targets is an estimate based on the weight, density, voidage and shape.

Uncertainty factors on volumes:  
 Stock (upper): x 1.0 Arisings (upper) x 10.0  
 Stock (lower): x 0.5 Arisings (lower) x 0.1

**WASTE SOURCE**

ISIS is a government-funded, working pulsed neutron spallation source which provides neutron (and muon) beams for research work. The neutrons are produced by bombarding a tantalum-clad tungsten target with protons. This waste stream is the waste neutron spallation targets from both of the ISIS target stations.

**PHYSICAL CHARACTERISTICS**

General description: Intact tungsten metal neutron spallation sources with tantalum metal cladding, disconnected from their cooling-water circuits and drained of the cooling water. This material is essentially the same as it was pre-irradiation other than the presence of activation products. Solid metallic tungsten with smaller quantities of tantalum metal.

Physical components (%vol): NOT SPECIFIED - Exact proportion of tungsten metal (major component) to tantalum metal depends on the target station and this waste stream is a mixture of both.

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m<sup>3</sup>): ~12

Comment on density: -

**CHEMICAL COMPOSITION**

General description and components (%wt): -

Chemical state: -

Chemical form of radionuclides: H-3: Bound into the metal

**WASTE STREAM****6N01****Neutron Targets**

Potential for the waste to contain discrete items:

Yes. Durable metal items

**PACKAGING AND CONDITIONING**

Conditioning method: This will be undertaken by the MBGWS at Sellafield as this waste is sent, intact, to that location and title for the waste is transferred.

Plant Name:

-

Location:

-

Plant startup date:

-

Total capacity  
(m<sup>3</sup>/y incoming waste):

-

Target start date for packaging this stream:

-

Throughput for this stream  
(m<sup>3</sup>/y incoming waste):

-

Other information:

-

Likely container type:

Container	Waste packaged (%vol)	Waste loading (m <sup>3</sup> )	Payload (m <sup>3</sup> )	Number of packages

Likely container type comment:

-

Range in container waste volume:

-

**RADIOACTIVITY**

Source:

Proton collision with metals of target.

Uncertainty:

All activities are calculated not measured. Volumes of waste are very small but there is a large % uncertainty on the exact volume of each waste target used for these calculations. The targets do not exceed 200 litres as one TS1 current and new design target fits into a 200 litre can for transport and 3 x TS2 targets will fit into another 200 litre can. The minimum volumes may be as low as TS1 target 20 litres and TS2 targets 10 litres.

**WASTE STREAM****6N01****Neutron Targets**

Definition of total alpha and total beta/gamma:	Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
Measurement of radioactivities:	Calculations from MCNPX and CINDER90 programs. The specific activities for targets from the 2 target stations are different, but for this submission have been blended into one fingerprint for the current holdings.
Other information:	'Other beta/gamma' is composed mainly of Ta-182 (81% by specific activity), Ta-179 (12%), W-181 (4%), Lu-173 (2%) and Hf-172 (2%). 'Other alpha' is solely composed of Gd-148.
