Comment on volumes: Assumed 5x TS1 columns changed every 5 years and assumed that 1x TS2 column is changed every 2 years based on current arisings. Volumes have been calculated using the density of the resin as per the MSDS and the estimated resin weight from drawings.

Uncertainty factors on volumes: Stock (upper): x 1.5 Arisings (upper) x 1.5  
 Stock (lower): x 0.5 Arisings (lower) x 0.5

**WASTE SOURCE** Contaminated ion exchange resin from target, reflector and moderator cooling circuits (activated D2O and light water).

**PHYSICAL CHARACTERISTICS**

General description: Solid bead-like ion exchange resin, likely to be damp. Nitrogen is blown through the circuits to remove as much free liquid as possible.

Physical components (%wt): Amberlite IRN77 and IRN78 ion exchange resin (100%).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m<sup>3</sup>): ~1.2

Comment on density: Estimated density of damp resin.

**RADIOACTIVITY**

Source: Contamination from activated cooling water/D2O circuits.

Uncertainty: -

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Measurements made to legacy ion exchange material has been used to determine the activity of current and future arisings, along with measurments of the associated cooling water which runs through the resin.
