WASTE SOURCE Steel support structures/shielding from the decommissioning of the ISIS neutron source.**PHYSICAL CHARACTERISTICS**

General description: Activated steel
 Physical components (%wt): mild steel (100%)
 Sealed sources: The waste does not contain sealed sources.
 Bulk density (t/m³): 7.8
 Comment on density: Based on the density of steel.

TREATMENT, PACKAGING AND DISPOSAL

Waste that is currently ILW: Decay Storage Not yet assessed

WASTE STREAM

6N102 Decommissioning Bulk Steel

Planned on-site / off-site treatment(s):

Treatment	On-site / Off site	Stream volume %	
Low force compaction	On-site	~95.0	
Supercompaction (HFC)			
Incineration			
Solidification			
Decontamination			
Metal treatment			
Size reduction			
Decay storage			
Recycling / reuse			~5.0
Other / various			
None			

Comment on planned treatments:

Decay storage will divert majority of waste away from ILW disposal. Anticipate ~5% will not be divertable to LLW by decay storage.

Disposal Routes:

Disposal Route	Stream volume %	Disposal density t/m3
Expected to be consigned to the LLW Repository	~5.0	~7.8
Expected to be consigned to a Landfill Facility	~20.0	~7.8
Expected to be consigned to an On-Site Disposal Facility		
Expected to be consigned to an Incineration Facility		
Expected to be consigned to a Metal Treatment Facility		
Expected to be consigned as Out of Scope	~70.0	~7.8
Expected to be recycled / reused		
Disposal route not known	~5.0	~7.8

RADIOACTIVITY

Source: Neutron activation.

Uncertainty: No characterisation has yet been undertaken so the nuclide list is based on a generic mild steel fingerprint with the data collected from other mild steel components from ISIS.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Derived from operational steel wastes as not yet been characterised. The activity is calculated on the assumption that the inner monolith (~15% by volume) is similar to current shutter wastes and remaining bulk shielding (~85% by volume) is similar to current bulk metal arrisings. The reported activity is the weighted sum of these two sources
