	1.4.2059 - 31.3.2060.....	5.0 m ³
	1.4.2061 - 31.3.2080.....	0 m ³
Total future arisings:		12.5 m ³
Total waste volume:		39.9 m ³

Comment on volumes: No major stock change since 2016. Future arisings have been derived from waste operational predictions. Stock volume are recorded in a recently issued database, and are therefore considered to be accurate. The total volume of arisings will depend on the longevity of the AWE site, with estimates based on a site closure date of 2080.

Uncertainty factors on volumes: Stock (upper): x 1.0 Arisings (upper) x 5.0
 Stock (lower): x 1.0 Arisings (lower) x 0.5

WASTE SOURCE Operations involving tritium.**PHYSICAL CHARACTERISTICS**

General description: Mainly metallic content.

Physical components (%wt): Metal (49.57%), cellulose (4.69%), halogenated plastics (17.61%), non-halogenated plastics (22.45%), ceramics (2.89%), and vermiculite (2.79%). The composition has been reviewed and is very similar to the 2019 composition, so has remained the same.

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): 0.46

Comment on density: Stock reviewed and very similar to the figure quoted in 2019. The total stream mass has been divided by the total stream volume.

CHEMICAL COMPOSITION

General description and components (%wt): Metal (49.57%), cellulose (4.69%), halogenated plastics (17.61%), non-halogenated plastics (22.45%), ceramics (2.89%), and vermiculite (2.79%).

Chemical state: Neutral

Chemical form of radionuclides: H-3: Present in the waste stream through diffusion and uranium/titanium tritride (HTO, HT and organically/chemically bound)
 C-14: Not present in Waste Stream
 Cl-36: Not present in Waste Stream
 Se-79: Not present in Waste Stream
 Tc-99: Not present in Waste Stream
 I-129: Not present in Waste Stream
 Ra: Only daughter products present from uranium in this waste stream. Oxide form.
 Th: Only daughter products present from uranium in this waste stream. Oxide form.
 U: Present in Waste Stream as oxide form
 Np: Not present in Waste Stream
 Pu: Not present in Waste Stream

PACKAGING AND CONDITIONING

Conditioning method: -
 Plant Name: -
 Location: -
 Plant startup date: -
 Total capacity (m³/y incoming waste): -
 Target start date for packaging this stream: -
 Throughput for this stream (m³/y incoming waste): -
 Other information: -

Likely container type:	Container	Waste packaged (%vol)	Waste loading (m³)	Payload (m³)	Number of packages
	500 l drum	100.0	~1	~0.5	40

Likely container type comment: The loading is an estimate based on experience with similar waste at Sellafield.

Range in container waste volume: Supercompaction of the waste drums will allow 5 pucks to be added into a 500 litre drum.

Other information on containers: Not specified

Likely conditioning matrix: Not Specified

Other information: -

Conditioned density (t/m³): ~2.0

Conditioned density comment: The conditioned density is an estimate which is subject to change

Other information on conditioning: There are no detailed conditioning plans

Opportunities for alternative disposal routing: -

Baseline Management Route	Opportunity Management Route	Stream volume (%)	Estimated Date that Opportunity will be realised	Opportunity Confidence	Comment
-	-	-	-	-	-

RADIOACTIVITY

Source:	Tritium contamination diffused into items and as surface contamination or dust.
Uncertainty:	Revised specific activity for stock wastes has been taken from the on-site waste database and is considered accurate. Predicted waste activities are more difficult and have been based on knowledge of arisings coupled with stock data. Tritium storage bed (TSB) devices include 100 grams depleted uranium per container. One TSB is in stock and 24 will be disposed in with the future arisings.
Definition of total alpha and total beta/gamma:	Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
Measurement of radioactivities:	Individual ILW items are assayed using calorimetry, mass balance or head-space analysis of a drum. Sampling followed by destructive assay is used to a lesser degree.
Other information:	-
