

WASTE STREAM	9A39	FED Magnox
---------------------	-------------	-------------------

SITE Berkeley

SITE OWNER Nuclear Decommissioning Authority

WASTE CUSTODIAN Magnox Limited

WASTE TYPE ILW

Is the waste subject to Scottish Policy: No

WASTE VOLUMES

Stocks:	At 1.4.2022.....	Reported 16.0 m ³
---------	------------------	---------------------------------

Total future arisings:		0 m ³
------------------------	--	------------------

Total waste volume:		16.0 m ³
---------------------	--	---------------------

Comment on volumes: Station operation ceased in March 1989. This waste stream was accumulated between May 1964 and December 1967. The volume quoted is the estimated bulk volume of the waste if separated from other wastes with which it is mixed.

Uncertainty factors on volumes:	Stock (upper):	x 1.3	Arisings (upper)	x
	Stock (lower):	x 0.8	Arisings (lower)	x

WASTE SOURCE The source of the waste is the removal of splitters and top end guides from fuel elements prior to dispatch of the elements to Sellafield.

PHYSICAL CHARACTERISTICS

General description: The waste comprises Magnox splitters and top end guides removed from fuel elements prior to dispatch of the element to Sellafield. These sections were removed during the desplitting operation. The desplitting process can distort the splitter assemblies and splitters, and can break the top end guide. The Magnox splitters and top end guide are 496mm and 107mm in length respectively. Components may weigh up to about 30g. The total weight of Magnox removed from each element was 118g. From the dimensions and masses quoted above and recognising that the components will be broken and distorted during the desplitting operation it is therefore unlikely that there will be any large items which will require special handling.

Physical components (%vol): Magnox is the only constituent identified (>99%vol).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): 0.57

Comment on density: The density of 0.57 t/m³ assumes a packing factor to give an overall volume of about three times the displacement volume of the waste. The actual density can be up to 1.7 t/m³.

CHEMICAL COMPOSITION

General description and components (%wt): Magnox metal (Type AL80) >99% wt. Fission product and actinide contamination. Also graphite contamination. Activation of impurities within the Magnox.

Chemical state: Alkali

Chemical form of radionuclides: H-3: Tritium is expected to be present as surface contamination, possibly as water, but perhaps in the form of other inorganic or organic compounds.

C-14: Carbon 14 will probably be present as graphite.

Cl-36: Chlorine 36 incorporated in the Magnox may be associated with barium impurity (barium chloride). Other chlorine 36 may be associated with surface contamination.

Se-79: The selenium content is insignificant.

Tc-99: The technetium content is insignificant.

Ra: Radium isotope content is insignificant.

Th: The thorium isotope content is insignificant.

U: Chemical form of U isotopes has not been determined but may be oxides.

Np: The neptunium content is insignificant.

Pu: Chemical form of Pu isotopes has not been determined but may be oxides.

Metals and alloys (%wt): The thickness of some 75% wt of the waste will be of the order of a mm or less, the other 25% wt of the waste will be a few mm thick.

Potential for the waste to contain discrete items: Yes. In & of itself not a DI; Will likely contain "rogue" items (HDRIs) that will be (see Nimonic/Others)

PACKAGING AND CONDITIONING

Conditioning method: This stream will be co-packaged with 9A25, 9A31, 9A47, 9A52, 9A60 and 9A66 in Type VI DCIC containers. Remainder of vault 1 waste streams will be co-packaged together in Concrete boxes (9A61, 9A62, 9A67, 9A32, 9A40, 9A48, 9A53, 9A73) Packages for vault 1 are assigned to 9A25, 9A32 & 9A73.

RADIOACTIVITY

Source:	Activation, when the associated fuel elements were irradiated, of nuclides incorporated into the Magnox. Contamination by fission products and actinides when the fuel elements were in the fuel pond.
Uncertainty:	The values quoted are indicative of the activities that might be expected.
Definition of total alpha and total beta/gamma:	Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.
Measurement of radioactivities:	Specific activity is a function of Station operating history. Values were derived from measurements, calculations of induced activity and estimates of likely contamination.
Other information:	-
