

WASTE STREAM	9F321	Contaminated Soil LLW
---------------------	--------------	------------------------------

SITE Sizewell A
SITE OWNER Nuclear Decommissioning Authority

WASTE CUSTODIAN Magnox Limited

WASTE TYPE LLW

Is the waste subject to Scottish Policy: No

WASTE VOLUMES

		Reported
Stocks:	At 1.4.2022.....	0 m ³
Future arisings -	1.4.2092 - 31.3.2095.....	308.0 m ³
Total future arisings:		308.0 m ³
Total waste volume:		308.0 m ³

Comment on volumes: Waste volumes have been reassessed since publication of the 2007 Inventory. Final Dismantling & Site Clearance is assumed to commence in 2088 with reactor dismantling commencing in 2092 and lasting for three years. Volumes and radioactivity have been calculated for 85 years after reactor shutdown, i.e. 2091.

Uncertainty factors on volumes: Stock (upper): x Arisings (upper) x 1.2
 Stock (lower): x Arisings (lower) x 0.8

WASTE SOURCE Contaminated soil that has resulted from plant operation and maintenance.

PHYSICAL CHARACTERISTICS

General description: Based on upper natural material descriptions: Predominantly rounded sand and gravel sized material with some inclusion of silty clay horizons (levels). Upper horizons also likely to include fragments of concrete, brick and metalwork. Possible encounter with up to cobble sized gravel.

Physical components (%vol): Sand (45%), gravel (35%), clay (15%), others (5%) (fragments of concrete, brick, metal).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): ~1.5

Comment on density: The bulk density is an estimate and may be subject to revision. Assumes bulkage factor (physical expansion) of 1.3. Available information about the soil types indicates that the bulkage factor could be 1.2 and the density would then be 1.6t/m³.

CHEMICAL COMPOSITION

General description and components (%wt): Soil, rubble, organic material and water. Percentages are not estimated.

Chemical state: Neutral

Chemical form of radionuclides: H-3: The tritium content is insignificant.
 C-14: The carbon 14 content is insignificant.
 Cl-36: The chlorine 36 content is insignificant.
 Se-79: The selenium content is insignificant.
 Tc-99: The technetium content is insignificant.
 Ra: The radium isotope content is insignificant.
 Th: The thorium isotope content is insignificant.
 U: The uranium isotope content is insignificant.
 Np: The neptunium content is insignificant.
 Pu: The plutonium isotope content is insignificant.

Metals and alloys (%wt): There are no bulk or sheet metal items present in the waste.

	(%wt)	Type(s) / Grade(s) with proportions	% of total C14 activity
Stainless steel.....	0		
Other ferrous metals.....	0		
Iron.....			
Aluminium.....	0

RADIOACTIVITY

Source: Contamination that has resulted from plant maintenance and operation. Cs-137 is expected to dominate.

Uncertainty: Only approximate estimates have been made of the total specific activities. The estimates are typical of measurements at other sites, the activity may vary either way by a factor of 10. The activities quoted are those at the time of final site decommissioning.

Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities: Provision of detailed data will have to await detailed site characterisation.

Other information: The activities quoted are those at 85 years after reactor shutdown, i.e. in 2091. No radionuclides other than those listed are expected to be significant.
