Potential for the waste to contain discrete items:      No. In & of itself not a DI; waste stream may include DIs (notably any stainless steel components)

**PACKAGING AND CONDITIONING**

Conditioning method:      Separate waste stream was identified from 9H25 to recognise potential Type B status of tin 53. There are no containers allocated to this stream as the intent would be to co-package with IP-2 waste for on site storage possibly in a MOSAIK. This waste would be over-packed for GDF transport. This is subject to the necessary BAT studies/disposability assessments and has not been confirmed.

**RADIOACTIVITY**

Source: The main source of activity are the activation products Fe-55, H-3, Co-60 and Cl-36.  
 Uncertainty: Specific activity is a function of Station operating history.  
 Definition of total alpha and total beta/gamma: Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.  
 Measurement of radioactivities: Specific activities are based upon M/EF/WYA/EAN/0006/19
