SITE Hunterston A

SITE OWNER Nuclear Decommissioning Authority

WASTE CUSTODIAN Magnox Limited

WASTE TYPE ILW

Is the waste subject to

Scottish Policy:

Yes

WASTE VOLUMES

Total waste volume:

Comment on volumes: Waste arisings are assumed to occur at a uniform rate over 5 years. Final Dismantling &

Site Clearance is assumed to commence in 2071 with reactor dismantling commencing in 2075 and lasting for 5 years. The volumes and radioactivity have been calculated for 85

67.0 m³

years after reactor shutdown, i.e. 2075.

Uncertainty factors on Stock (upper): x Arisings (upper) x 1.2 volumes: Stock (lower): x Arisings (lower) x 0.8

WASTE SOURCE Stainless steel items from reactor dismantling.

PHYSICAL CHARACTERISTICS

General description: A variety of stainless steel items. Physical components (%wt): Stainless steel items (100%).

Sealed sources: The waste does not contain sealed sources.

Bulk density (t/m³): ~1.4

Comment on density: The density is of the waste as cut for packaging.

CHEMICAL COMPOSITION

General description and components (%wt):

Stainless steel (100%).

Chemical state: Neutral

Chemical form of

H-3: The tritium content is insignificant.

radionuclides: C-14: Carbon 14 will be incorporated in the steel. There may also be some graphite

contamination.

CI-36: Chlorine 36 will be incorporated in the steel. Se-79: The selenium content is insignificant. Tc-99: The technetium content is insignificant. Ra: The radium content is insignificant. Th: The thorium content is insignificant. U: The uranium content is insignificant. Np: The neptunium content is insignificant.

Pu: The plutonium content is insignificant.

Metals and alloys (%wt): Items will have been cut for packaging. Thicknesses are likely to vary from a few mm to

about 25 mm.

waste stream is stainless steel

(EN58B).

Potential for the waste to contain discrete items:

Yes. Large Metal Items (LMIs)/"substantial" thickness items considered "durable" assumed DIs; All stainless items assumed DIs. NB if recycled then DI Limits n/a

PACKAGING AND CONDITIONING

Conditioning method: The waste is not expected to be supercompacted. It will be placed in baskets in the

waste packages and encapsulated in 4m Stainless Steel ILW Boxes.

Plant Name: None

Hunterston A Decommissioning Site. Location:

Plant startup date: 2075 Total capacity ~5000.0

(m³/y incoming waste):

2075 Target start date for

packaging this stream:

Throughput for this stream ~7.5

(m³/y incoming waste):

The waste will be packaged immediately after the reactors are dismantled. It will be

placed in basket and encapsulated. Basket of different ILW waste may be in the

same package.

Likely container type:

Other information:

Container	Waste packaged (%vol)	Waste loading (m³)	Payload (m³)	Number of packages
4m box (no shielding)	100.0	~16.2	18.9	5

Likely container type

comment:

The waste is assumed to be in baskets in the waste package so the occupied volume in

the package is greater than the original waste volume.

Range in container waste

volume:

Not yet determined. No significant variability is expected.

Other information on

containers:

The container material is expected to be stainless steel. Container choice may be

influenced by Transport Regulations at the time of final site clearance.

Likely conditioning matrix:

Other information:

Blast Furnace Slag / Ordinary Portland Cement

The waste is to be encapsulated.

Conditioned density (t/m³):

Conditioned density

comment:

~3.0

The conditioned wasteform density assumes that the waste will be encapsulated.

Other information on

conditioning:

The waste will be in baskets placed in the waste packages. Baskets of different Final Dismantling & Site Clearance ILW wastes may be in the same waste package. Should

encapsulation not be required, the density of the conditioned waste product would be

about 1.2 t/m3.

Opportunities for alternative disposal routing:

Baseline Opportunity Management Route Management Route	Stream volume (%)	Estimated Date that Opportunity will be realised	Opportunity Confidence	Comment
--	----------------------	--	---------------------------	---------

RADIOACTIVITY

Source: Activation of the stainless steel and impurities.

Uncertainty: The values quoted were derived by calculation from available material specification and

are indicative of the activities that are expected. The major source of uncertainty is the

impurity levels.

Definition of total alpha and total beta/gamma:

Where totals are shown on the table of radionuclide activities they are the sums of the listed alpha or beta/gamma emitting radionuclides plus 'other alpha' or 'other beta/gamma'.

Measurement of radioactivities:

The specific activities were estimated from neutron activation calculations of the material and its impurities

and its impurities.

Other information: The activities quoted are those at 85 years after reactor shutdown, i.e. in 2075. There may

be some contamination by Cs137.
